Problem 1

I have practiced the visualization and programming basics in Primers

Problem 2

Part A

What I hope to get out of this class as follows,

- 1. How to be reproducible to collaborate with others and even myself
- 2. How to write effective codes
- 3. How to make nice reports using R Markdown (Be a nice statistician)
- 4. Getting used to R Markdown and GitHub

I feel lucky to take this class.

Part B

Binomial, Gamma, Beta pdfs from Casella & Berger

$$P(X = x | n, p) = \binom{n}{x} p^x (1 - p)^{1 - x}.$$
 (1)

$$P(X|\alpha,\beta) = \frac{1}{\gamma(\alpha)\beta^{\alpha}} x^{\alpha-1} e^{-\frac{x}{\beta}}.$$
 (2)

$$P(X|\alpha,\beta) = \frac{1}{\gamma(\alpha)\beta^{\alpha}} x^{\alpha-1} e^{-\frac{x}{\beta}}.$$

$$P(X|\alpha,\beta) = \frac{1}{B(\alpha,\beta)} x^{\alpha-1} (1-x)^{\beta-1}.$$
(2)

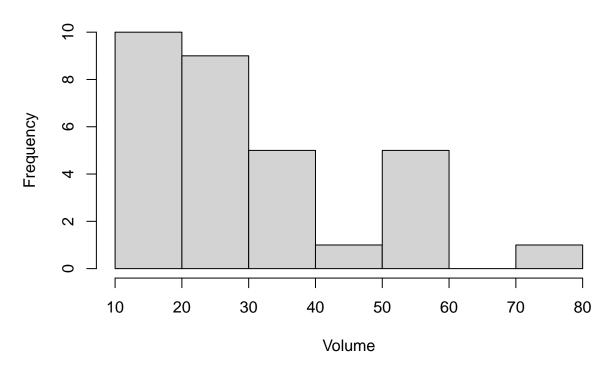

Problem 3

- 1. Rule 1. For Every Result, Keep Track of How It Was Produced
 - Recording every detail is important for reproducibility.
 - Details such as the name and version of the program, parameters and inputs are critical.
- 2. Rule 2. Avoid Manual Data Manipulation Steps
 - Rely on codes, not on manual procedures such as Excel to reproduce.
- 3. Rule 3. Archive the Exact Versions of All External Programs Used
 - A newer version of a program may not run even without any change of inputs.
- 4. Rule 4. Version Control All Custom Scripts
 - Only one exact script may be able to produce that exact output.
 - Sometimes, backtracking to a code state is needed.
 - Use GitHub.
- 5. Rule 5. Record All Intermediate Results, When Possible in Standardized Formats
 - Looking through intermediate results can uncover discrepancies toward what is assumed, and can
 find bugs or faulty interpretations.
 - It reveals consequences of alternative programs and parameter choices at each steps.
 - It allows parts of the process to be rerun.
 - One can track the steps where the problems appears.
 - Without full operation, one can examine the full process.
- 6. Rule 6. For Analyses That Include Randomness, Note Underlying Random Seeds
 - Providing the same random seed allows results to be reproduced exactly in future runs.
- 7. Rule 7. Always Store Raw Data behind Plots
 - It allows raw data for a given figure to be easily retrieved.
 - one can easily modify the plotting procedure, without redoing the whole analysis.
- 8. Rule 8. Generate Hierarchical Analysis Output, Allowing Layers of Increasing Detail to Be Inspected
 - Hypertext is the best example.
 - By simple clicks, we can easily view the full data underlying the summary of results with links.
- 9. Rule 9. Connect Textual Statements to Underlying Results
 - Connect results to the statements that are initially formulated such as notes or emails.
 - It is important to provide details along with your textual interpretations to the results to be tracked down in the future.
- 10. Rule 10. Provide Public Access to Scripts, Runs, and Results
 - All inputs, scripts, versions, parameters, and intermediate results should be provided publicly and easily accessible.
 - GitHub is a good tool.

Problem 4

```
### Problem 4 : A Scatter Plot and A Histogram ###
# R version 4.0.2
library(help = 'datasets') # To get a list of the datasets
summary(trees)
                           # Summary of trees data
##
        Girth
                       Height
                                    Volume
## Min. : 8.30
                                Min. :10.20
                   Min. :63
## 1st Qu.:11.05
                   1st Qu.:72
                                1st Qu.:19.40
## Median :12.90
                                Median :24.20
                   Median:76
## Mean
         :13.25
                  Mean :76
                                Mean :30.17
## 3rd Qu.:15.25
                   3rd Qu.:80
                                3rd Qu.:37.30
## Max.
          :20.60 Max.
                          :87
                                Max.
                                      :77.00
### A basic scatter plot from 'trees' data using ggplot2
library(ggplot2)
                          # To use ggplot function
ggplot(data = trees) +
geom_point(mapping = aes(x = Height, y = Volume, color = Girth))
  80 -
  60 -
                                                                               Girth
Nolume 40 -
                                                                                   18
                                                                                  15
                                                                                   12
  20 -
                          70
                                                     80
                                     Height
### Histogram for 'trees' data
hist(trees$Volume, main ='Histogram of Volume of Trees', xlab = 'Volume')
```

Histogram of Volume of Trees

Problem 5

Push to GitHub

Appendix: R codes

```
knitr::opts_chunk$set(echo = TRUE)

### Problem 4 : A Scatter Plot and A Histogram ###

# R version 4.0.2
library(help = 'datasets') # To get a list of the datasets
summary(trees) # Summary of trees data

### A basic scatter plot from 'trees' data using ggplot2
library(ggplot2) # To use ggplot function
ggplot(data = trees) +
   geom_point(mapping = aes(x = Height, y = Volume, color = Girth))

### Histogram for 'trees' data
hist(trees$Volume, main ='Histogram of Volume of Trees', xlab = 'Volume')
```
